

PROCELL THERAPIES' HAIR AFTERCARE

SCALP HAIR GROWTH & NUTRITION

Procell Therapies Hair Aftercare contains targeted growth factors designed to support the Wnt/ β -catenin cell signaling pathway, a critical form of cellular communication involved in hair follicle function, cycling, and growth. Wnt/ β -catenin signaling plays a central role in stimulating hair follicles to transition from the telogen (resting) phase into the anagen (active growth) phase. Consistent daily use of Procell Therapies Hair Aftercare containing signaling growth factors helps support cellular activity around the hair to awaken dormant follicles and give visible improvement to hair density, quality, and growth patterns.

INSTRUCTIONS

DAILY USE

- Ensure the scalp is clean and dried.
- Shake the vial well.
- Apply several drops of hair serum directly to the thinning areas of concern.
- Lightly massage or gently comb the serum into the scalp.
- Allow the serum to be fully absorbed before brushing aggressively or applying styling products.

BEFORE & AFTER YOUR PROFESSIONAL TREATMENT

- After your treatment, wait 24 hours before applying the aftercare. Daily use may begin on the second day following your session.
- DO NOT dry hair after showering aggressively with a towel. This will decrease shedding and stress on follicles during treatment.
- The serum can be used until the day of your microchanneling treatment. Please arrive with a clean scalp free of aftercare serum, oils, sprays, or any styling products.

THE RESULTS

- Supports the Wnt/ β -catenin signaling pathway involved in hair follicle development and growth.
- Helps encourage follicles to transition from the resting phase into the active growth phase.
- Reduces the appearance of hair loss from excessive shedding over time.
- Supports increased fullness and density.
- Improves overall hair appearance.

For best results, pair daily home hair serum use with professional Procell microchanneling hair treatments from your provider.
